

Divvy_Exercise_Full_Year_Analysis

This analysis is based on the Divvy case study "Sophisticated, Clear, and Polished": Divvy and Data Visualization" written by Kevin Hartman (found here: <https://artscience.blog/home/divvy-dataviz-case-study>). The purpose of this script is to consolidate downloaded Divvy data into a single dataframe and then conduct simple analysis to help answer the key question: "In what ways do members and casual riders use Divvy bikes differently?"

#####

Install required packages

tidyverse for data import and wrangling

lubridate for date functions

ggplot for visualization

#####

library(tidyverse) #helps wrangle data

library(lubridate) #helps wrangle date attributes

library(ggplot2) #helps visualize data

getwd() #displays your working directory

setwd("/Users/kevinhartman/Desktop/Divvy_Exercise/csv") #sets your working directory to simplify calls to data ... make sure to use your OWN username instead of mine ;)

#=====

STEP 1: COLLECT DATA

#=====

Upload Divvy datasets (csv files) here

q2_2019 <- read_csv("Divvy_Trips_2019_Q2.csv")

q3_2019 <- read_csv("Divvy_Trips_2019_Q3.csv")

q4_2019 <- read_csv("Divvy_Trips_2019_Q4.csv")

q1_2020 <- read_csv("Divvy_Trips_2020_Q1.csv")

#=====

STEP 2: WRANGLE DATA AND COMBINE INTO A SINGLE FILE

#=====

Compare column names each of the files

While the names don't have to be in the same order, they DO need to match perfectly before we can use a command to join them into one file

colnames(q3_2019)

colnames(q4_2019)

colnames(q2_2019)

colnames(q1_2020)

```
# Rename columns to make them consistent with q1_2020 (as this will be the supposed  
going-forward table design for Divvy)
```

```
(q4_2019 <- rename(q4_2019  
  ,ride_id = trip_id  
  ,rideable_type = bikeid  
  ,started_at = start_time  
  ,ended_at = end_time  
  ,start_station_name = from_station_name  
  ,start_station_id = from_station_id  
  ,end_station_name = to_station_name  
  ,end_station_id = to_station_id  
  ,member_casual = usertype))
```

```
(q3_2019 <- rename(q3_2019  
  ,ride_id = trip_id  
  ,rideable_type = bikeid  
  ,started_at = start_time  
  ,ended_at = end_time  
  ,start_station_name = from_station_name  
  ,start_station_id = from_station_id  
  ,end_station_name = to_station_name  
  ,end_station_id = to_station_id  
  ,member_casual = usertype))
```

```
(q2_2019 <- rename(q2_2019  
  ,ride_id = "01 - Rental Details Rental ID"  
  ,rideable_type = "01 - Rental Details Bike ID"  
  ,started_at = "01 - Rental Details Local Start Time"  
  ,ended_at = "01 - Rental Details Local End Time"  
  ,start_station_name = "03 - Rental Start Station Name"  
  ,start_station_id = "03 - Rental Start Station ID"  
  ,end_station_name = "02 - Rental End Station Name"  
  ,end_station_id = "02 - Rental End Station ID"  
  ,member_casual = "User Type"))
```

```
# Inspect the dataframes and look for incongruencies
```

```
str(q1_2020)
```

```
str(q4_2019)
```

```
str(q3_2019)
```

```
str(q2_2019)
```

```
# Convert ride_id and rideable_type to character so that they can stack correctly
```

```
q4_2019 <- mutate(q4_2019, ride_id = as.character(ride_id))
```

```

    ,rideable_type = as.character(rideable_type))
q3_2019 <- mutate(q3_2019, ride_id = as.character(ride_id)
    ,rideable_type = as.character(rideable_type))
q2_2019 <- mutate(q2_2019, ride_id = as.character(ride_id)
    ,rideable_type = as.character(rideable_type))

# Stack individual quarter's data frames into one big data frame
all_trips <- bind_rows(q2_2019, q3_2019, q4_2019, q1_2020)

# Remove lat, long, birthyear, and gender fields as this data was dropped beginning in 2020
all_trips <- all_trips %>%
  select(-c(start_lat, start_lng, end_lat, end_lng, birthyear, gender, "01 - Rental Details Duration
In Seconds Uncapped", "05 - Member Details Member Birthday Year", "Member Gender",
"tripduration"))

#=====
# STEP 3: CLEAN UP AND ADD DATA TO PREPARE FOR ANALYSIS
#=====
# Inspect the new table that has been created
colnames(all_trips) #List of column names
nrow(all_trips) #How many rows are in data frame?
dim(all_trips) #Dimensions of the data frame?
head(all_trips) #See the first 6 rows of data frame. Also tail(all_trips)
str(all_trips) #See list of columns and data types (numeric, character, etc)
summary(all_trips) #Statistical summary of data. Mainly for numerics

# There are a few problems we will need to fix:
# (1) In the "member_casual" column, there are two names for members ("member" and
"Subscriber") and two names for casual riders ("Customer" and "casual"). We will need to
consolidate that from four to two labels.
# (2) The data can only be aggregated at the ride-level, which is too granular. We will want to
add some additional columns of data -- such as day, month, year -- that provide additional
opportunities to aggregate the data.
# (3) We will want to add a calculated field for length of ride since the 2020Q1 data did not have
the "tripduration" column. We will add "ride_length" to the entire dataframe for consistency.
# (4) There are some rides where tripduration shows up as negative, including several hundred
rides where Divvy took bikes out of circulation for Quality Control reasons. We will want to
delete these rides.

# In the "member_casual" column, replace "Subscriber" with "member" and "Customer" with
"casual"
# Before 2020, Divvy used different labels for these two types of riders ... we will want to make
our dataframe consistent with their current nomenclature

```

```

# N.B.: "Level" is a special property of a column that is retained even if a subset does not
contain any values from a specific level
# Begin by seeing how many observations fall under each usertype
table(all_trips$member_casual)

# Reassign to the desired values (we will go with the current 2020 labels)
all_trips <- all_trips %>%
  mutate(member_casual = recode(member_casual
                                , "Subscriber" = "member"
                                , "Customer" = "casual"))

# Check to make sure the proper number of observations were reassigned
table(all_trips$member_casual)

# Add columns that list the date, month, day, and year of each ride
# This will allow us to aggregate ride data for each month, day, or year ... before completing
these operations we could only aggregate at the ride level
# https://www.statmethods.net/input/dates.html more on date formats in R found at that link
all_trips$date <- as.Date(all_trips$started_at) #The default format is yyyy-mm-dd
all_trips$month <- format(as.Date(all_trips$date), "%m")
all_trips$day <- format(as.Date(all_trips$date), "%d")
all_trips$year <- format(as.Date(all_trips$date), "%Y")
all_trips$day_of_week <- format(as.Date(all_trips$date), "%A")

# Add a "ride_length" calculation to all_trips (in seconds)
# https://stat.ethz.ch/R-manual/R-devel/library/base/html/difftime.html
all_trips$ride_length <- difftime(all_trips$ended_at, all_trips$started_at)

# Inspect the structure of the columns
str(all_trips)

# Convert "ride_length" from Factor to numeric so we can run calculations on the data
is.factor(all_trips$ride_length)
all_trips$ride_length <- as.numeric(as.character(all_trips$ride_length))
is.numeric(all_trips$ride_length)

# Remove "bad" data
# The dataframe includes a few hundred entries when bikes were taken out of docks and
checked for quality by Divvy or ride_length was negative
# We will create a new version of the dataframe (v2) since data is being removed
# https://www.datasciencemadesimple.com/delete-or-drop-rows-in-r-with-conditions-2/
all_trips_v2 <- all_trips[!(all_trips$start_station_name == "HQ QR" | all_trips$ride_length < 0),]

#=====

```

STEP 4: CONDUCT DESCRIPTIVE ANALYSIS

#=====

Descriptive analysis on ride_length (all figures in seconds)

mean(all_trips_v2\$ride_length) #straight average (total ride length / rides)

median(all_trips_v2\$ride_length) #midpoint number in the ascending array of ride lengths

max(all_trips_v2\$ride_length) #longest ride

min(all_trips_v2\$ride_length) #shortest ride

You can condense the four lines above to one line using summary() on the specific attribute
summary(all_trips_v2\$ride_length)

Compare members and casual users

aggregate(all_trips_v2\$ride_length ~ all_trips_v2\$member_casual, FUN = mean)

aggregate(all_trips_v2\$ride_length ~ all_trips_v2\$member_casual, FUN = median)

aggregate(all_trips_v2\$ride_length ~ all_trips_v2\$member_casual, FUN = max)

aggregate(all_trips_v2\$ride_length ~ all_trips_v2\$member_casual, FUN = min)

See the average ride time by each day for members vs casual users

aggregate(all_trips_v2\$ride_length ~ all_trips_v2\$member_casual + all_trips_v2\$day_of_week,
FUN = mean)

Notice that the days of the week are out of order. Let's fix that.

all_trips_v2\$day_of_week <- ordered(all_trips_v2\$day_of_week, levels=c("Sunday", "Monday",
"Tuesday", "Wednesday", "Thursday", "Friday", "Saturday"))

Now, let's run the average ride time by each day for members vs casual users

aggregate(all_trips_v2\$ride_length ~ all_trips_v2\$member_casual + all_trips_v2\$day_of_week,
FUN = mean)

analyze ridership data by type and weekday

all_trips_v2 %>%

mutate(weekday = wday(started_at, label = TRUE)) %>% #creates weekday field using
wday()

group_by(member_casual, weekday) %>% #groups by usertype and weekday

summarise(number_of_rides = n()) #calculates

the number of rides and average duration

,average_duration = mean(ride_length)) %>% # calculates the average duration

arrange(member_casual, weekday) # sorts

Let's visualize the number of rides by rider type

all_trips_v2 %>%

mutate(weekday = wday(started_at, label = TRUE)) %>%

group_by(member_casual, weekday) %>%

summarise(number_of_rides = n())

```

    ,average_duration = mean(ride_length)) %>%
  arrange(member_casual, weekday) %>%
  ggplot(aes(x = weekday, y = number_of_rides, fill = member_casual)) +
  geom_col(position = "dodge")

```

Let's create a visualization for average duration

```

all_trips_v2 %>%
  mutate(weekday = wday(started_at, label = TRUE)) %>%
  group_by(member_casual, weekday) %>%
  summarise(number_of_rides = n()
    ,average_duration = mean(ride_length)) %>%
  arrange(member_casual, weekday) %>%
  ggplot(aes(x = weekday, y = average_duration, fill = member_casual)) +
  geom_col(position = "dodge")

```

```

#=====

```

```

# STEP 5: EXPORT SUMMARY FILE FOR FURTHER ANALYSIS

```

```

#=====

```

Create a csv file that we will visualize in Excel, Tableau, or my presentation software

N.B.: This file location is for a Mac. If you are working on a PC, change the file location

accordingly (most likely "C:\Users\YOUR_USERNAME\Desktop\...") to export the data. You can read more here: <https://datatofish.com/export-dataframe-to-csv-in-r/>

```

counts <- aggregate(all_trips_v2$ride_length ~ all_trips_v2$member_casual +

```

```

all_trips_v2$day_of_week, FUN = mean)

```

```

write.csv(counts, file = '~/Desktop/Divvy_Exercise/avg_ride_length.csv')

```

#You're done! Congratulations!
